3+ Years Experience | 6+ ETG Titles Shipped | 100+ Terminals Deployed Internationally

PROFESSIONAL PROFILE

Software Engineer with 3+ years of full-stack production experience at Light & Wonder — one of the world's largest gaming technology companies. Recognised for end-to-end feature ownership and cross-stack delivery; progressed from Software Engineering Intern to Senior Associate Software Engineer in under two years. Sole owner of Tournament Display — the platform's first server-driven, video-integrated display overlay. Experienced across C/C++ platform components, C#/.NET server-side systems, Unity game clients, and full-stack web tooling.

CORE COMPETENCIES

Feature Ownership · Client-Server Architecture · Unity Client Development · Backend Engineering
Performance Profiling · Debugging & Root-Cause Analysis · Rapid Prototyping · Cross-Functional Delivery
Internal Tooling · Agile Delivery · Production Debugging · International Market Delivery

TECHNICAL SKILLS

Core: C#, Unity, .NET Framework, WPF, C++, C

Domain: Client-server integration, Game design, Game logic implementation, Rapid prototyping

Additional: Python, JavaScript, SQL, Unity WebGL, Node.js, React, Three.js

Tools: Git, Perforce, Visual Studio, VS Code, Jira

Practices: Performance profiling, memory analysis, log-based debugging, root-cause analysis

PROFESSIONAL EXPERIENCE

Senior Associate Software Engineer | Light & Wonder

Mar 2025 – Present · Bengaluru, India

- Designed and delivered **Tournament Display** — the platform's first server-driven, video-integrated display overlay. Enabled casino operators to upload custom images and configure live video playback across multiple ETG titles, turning the tournament screen into a marketing surface they control.
- Built cross-game tournament support — client-server state sync, a live leaderboard, and a new animation layer for entry, standings, and results — one implementation serving every title on the platform.
- Own end-to-end feature delivery across Unity clients and C#/.NET Framework applications, from technical planning through integration, QA coordination, and release sign-off.
- Primary engineering contact** for Tournament systems and Ultimate Texas Hold'em across 5+ stakeholder groups spanning development, QA, art, and international teams in India, Australia, and the US.
- Resolve production defects across client, server, and platform layers using profiling, FPS monitoring, memory analysis, TCP/IP and Protocol Buffers diagnostics, and runtime log analysis.
- Delivered titles on **100+ casino terminals** across new international casino markets.
- Led AI-assisted ideation sessions within the studio — reducing time from concept to working prototype and eliminating multi-week alignment cycles.

Engineering Initiatives

Game Ideas & Prototyping Portal | Unity WebGL · Python · Three.js

- Built a browser-based platform enabling developers, artists, and business stakeholders to submit, review, and demo game concepts — hosting 10 titles via Unity WebGL, eliminating hardware dependency for client demos.
- Reduced concept validation and demo setup time from **2 months to 2 weeks**, democratising game concept evaluation beyond the core dev team.

QR-Based Player Feedback System | Node.js · React · Unity

- Engineered a QR-triggered feedback workflow embedded in ETG cabinets and demo setups — replacing informal verbal feedback with structured, auditable, compliance-ready player data.
- Built admin panel with automated Confluence sync; records directly usable in regulatory compliance reviews and player sentiment analysis.

- Built a studio-wide platform to capture, track, and surface AI-driven ideas — preventing duplicate work and giving managers weekly visibility into idea progression and team output.

Associate Software Engineer | Light & Wonder

Jul 2023 – Mar 2025 · Bengaluru, India

- Began on platform engineering contributing to **OS-level C/C++ components** (sockets, IPC) before transitioning into ETG game development — building strong low-level systems fundamentals.
- Transitioned into ETG server-side engineering using .NET, C#, and WPF — contributing to game logic, state management, and backend communication layers for live casino products.
- Self-taught Unity in a production environment and delivered Ultimate Texas Hold'em as a full, production-quality Unity client within a single project cycle — **zero prior Unity experience** at the start.
- Delivered **6+ ETG titles** on schedule across Unity client, server, and backend: Ultimate Texas Hold'em, Roulette & Variants, Roulette POD, Craps, Baccarat & Variants, Sic Bo, and SBJ Tournament — all shipped into international casino markets.
- Investigated Unity Addressables, performance optimisation strategies, and asset management techniques; resolved bottlenecks via profiling, FPS and memory analysis, and runtime log review with QA and server teams.

Software Engineering Intern | Light & Wonder

Feb 2023 – Jun 2023 · Bengaluru, India

- Built automated test suites using Robot Framework; integrated rapidly into cross-functional workflows through structured knowledge-transfer sessions.
- Converted to a **full-time Associate Software Engineer role within 5 months** based on technical contribution and team impact.

EDUCATION

B.E. in Information Science & Engineering · 2019 – 2023 · CGPA: 8.5 / 10

Dayananda Sagar Academy of Technology & Management, Bengaluru

- Final-year project: Software Defect Prediction using machine-learning models including Reinforcement Learning.
